

PowerSave

Installation:

Just go to Blender Preferences, click install and choose the zip file.

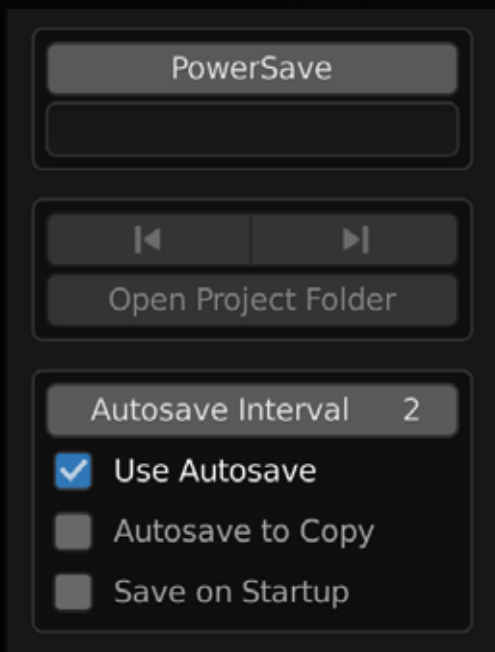

Setup your base *PowerSave* directory in the prefs. Your powersaved blends go there.

Usage:

After installation you have a new icon in the top bar. It is red, when your file is unsaved, and turns green, when your file is saved. Gray means saved, but with unsaved changes. (There is a high contrast version available in the preferences)

Clicking the icon opens the *PowerSave* panel.

Clicking the *PowerSave* button will save your file using the project name given in the text field, or a timestamp (configurable in the preferences), and saves it to your *PowerSave* directory.

If you use *PowerSave* with a previously saved file, it will use its location.

If the file already exists, clicking *PowerSave* will do an incremental save and add +1 at the end of the filename.

You can use slash to create a directory within your *PowerSave* or current directory without request.

The arrow icons open the previous/next iteration of your project. *Open project Folder* is self explanatory.

It will autosave to the current file in the set *Autosave Interval*.

If the *Autosave to Copy* option is set, autosave will not overwrite your current file and instead save with *_autosave* prefix. Setting this option also will keep track if a newer Autosave exists and offer to open the copy on load.

If you activate *Save on Startup* it will save every new session with the current timestamp.
